Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Neisseria meningitidis antigen, highly conserved between different strains - useful for prodn. of antibodies for immunisation against, or diagnosis of, N. meningitidis infection.

Claim 7; Fig 1; 117pp; English.

A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the

sphingolipids, glycosphingolipids, phosphosphingolipids, gangliosides,

```
ö
             humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

(TERM/) TERMAN D S.

Terman DS;

WPI; 2003-361759/34. N-PSDB; ACA64711. A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure, Page, 167pp, English.

The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCs). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumouricidal immunocyte population in vivo in a mammal (by allowing tumour associated lipids to context immunocytes in which receptors for immunosuppressive fatty acids, ceramides, glycolipids,

The invention relates to a process for producing an outer membrane vesicle (OMV) preparation from a bacterium. The process involves disrupting the bacterial membrane substantially in the absence of decorycholate detergent or other detergent, followed by several corritingation steps. Membrane disruption is achieveded by sonication, centrifugation steps. Membrane disruption is achieveded by sonication, homogenisation, microfluidisation, cavitation, osmocif shock, grinding, French press, belnding or any other physical technique. The outer membrane vesicles can be prepared from bacteria of the genera Moraxella, Shigella, Pseudomonas, Treponema, Porphyromonas, Helicobacter or Neisseria, and are particularly produced from Neisseria meningitidis (especially serogroup B) or Neisseria gonorrhoeae. The invention also relates to a Neisseria meningitidis outer membrane vesicle composition in which the vesicles include the immunogens Naph (Neisserial surface protein A, ADL16114), 287 protein (ADL16113) and 741 protein (ADL16112); and the use of outer membrane vesicle compositions as a medicament, especially for raising an immune response in a patient. The method is useful for manufacturing an outer membrane vesicle preparation as a vaccine against Neisseria meningitidis serogroup B. The present sequence represents Neisseria meningitidis serogroup B. The present sequence
                                                                                                                                                                                                                 Producing an outer membrane vesicle (OMV) preparation from a bacterium, useful as a vaccine against Neisseria meningitidis serogroup B, comprises disrupting the bacterial membrane in the absence of deoxycholate
                                                                                                                                                                                                                                                                                                                                                Disclosure, Fig 3; 20pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a receptor in a mammalian cell that inhibits regular activation by receptors specific for lipid-based tumour associated antigen. The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors, methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This is the amino acid sequence of Neisseria meningitidis lipopolysaccharide (LPS) to which tumour cells

The invention relates to an isolated refolded Neisserial surface protein to a (NspA) from Neisseria meningitidis or Neisseria gonorthoeae. The invention also relates to the method of refolding an NspA protein; an alkaline refolding buffer comprising ethanolamine and SB-12 (3-dimethyldodecylammoniopropanesulphorate) for refolding an NspA protein; a dimethyldodecylammoniopropanesulphorate) for refolding an NspA protein; a pharmaccutical composition comprising the refolded NspA protein; a carrier and optionally one or more other Neisserial antigens; a method of preventing or treating a Neisserial infection; an antibody immunospecific for the NspA protein; and diagnosing a Neisserial infection. NspA has conseed by Neisseria meningitidis (meningococcus), which causes invasive for the development of subunit vaccines for the treatment of infections caused by Neisserial diseases such as bacteraemia and meningitia, or Neisserial conseases such as bacteraemia and meningitis, or Neisserial conseases used in the development of gonorrhoea. Recombinantly produced consequently unable to adopt thair bologically active conformations, and frequently unable to adopt thair bologically active conformations, and frequently unable to adopt thair bologically active conformations, and yields may be very low due to mis-folding and aggregation of the protein. The method of the invention provides an improved method for refolding the conformation and it is possible to increase the recovery of active protein form partly purified inclusion bodies in amounts up to 100% the invention provides an improved Neph protein is useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrhoeae. The maximinities of the invention for diagnosing, treating or preventing the medical propers of the full-length NspA protein form partly prificed may be very buffered medical for preparing a composition for diagnosing, treating or preventing and aggrees described or preparation of the fu
                                                                                                                                   /note= "The corresponding residue in the mature protein shown in Fig 2 (residue 149) is Ala"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New refolded NapA protein, useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrheae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a pharmaceutical composition comprising a liposome associated with an isolated polypeptide derived from Neisseria meningitidis strain 608B, where the polypeptide is the Nuph protein. The composition is useful for inducing an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection and for treating and/or preventing neisserial infection chosen from N. meningitidis, N. gonorhoeae, N. lactamica and N. polysaccharea. It is useful for treatment or prophylaxis of meningitis and meningoceamia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is the Neisseria meningitidis strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 FAVDYTRYKNYKAPSTDFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDSF 120

The invention relates to a composition for treating a tumor or neoplastic disease in a subject. Also described: (1) a mammalian cell comprising an exogenous nucleic acid encoding a superantigen expressed in the cell, which cell also produces or expresses all alpha-anomers of monoglycosylceramide or diglycosylceramide; where expression of the manne or diglycosylceramide is capable of eliciting an antitumor immune response in a mammal into which the cell is introduced; (2) treating a tumor or neoplastic disease in a subject; (3) preparing a population of immunotherapeutic T or natural killer T (NKT) cells useful to treat a tumor or neoplastic disease in a subject; (4) an apoptotic cell preparation of limmunotherapeutic preparating a tumor or local susfic disease in a subject, comprising a cell population that has been transfected with the above apoptotic preparation or lysate, thus, condering the cell effective in presenting material expressed from transfecting nucleic acid or material ingested to the immune system of a mammal to elicit an anti-tumor immune response. The composition and methods are useful for treating tumores or neoplastic diseases The consent sequence represente a Neisseria meningitidis protein sequence which induces meningococcal meningitis, which is given in the exemplification of the present invention. Note - The sequence data for this patent is not represented in the printed specification, but was considered to be taken for the contract of this patent is electrically from the USPTO web site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FAVDYTRYKNYKAPSTDFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDSF 120

The invention relates to a novel composition comprising outer-membrane vesicles (OWV) prepared from a first strain of Neisseria meningitidis and 1 or more proteins which are present in OWVs prepared from a second strain of N. meningitidis, but which are not present in OWVs prepared from the first strain. The composition of the invention demonstrates antibacterial and antiinflammatory activities and may be useful in the field of meningococcal biochemistry, in particular the trafficking and localisation of meningococcal infections, possibly via the prevention or treatment of meningococcal infections, possibly via the production of a vaccine or gene therapy. The current sequence is that of a Neisseria meningitidis MCSB outer-membrane vesicle (OWV)-related membrane protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FAVDYTRYKNYKAPSTDFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDSF 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for identifying and quantifying one or more proteins in complex mixtures by selectively isolating peptides not containing the relative concentration of one or more proteins and determining the relative concentration of one or more proteins in different samples from the ratio between the areas of estimated different samples from the ratio between the areas of estimated to ach sample or samples of proteins; (b) chemically or chemically different sample or samples of proteins; (b) chemically modifying in each sample or samples (a) peptides obtained in step (a); (c) isolating the NHW peptides by cation exchange chromatography from the mixture of peptides obtained in step (b); (d) idontifying proteins by mass spectrometry analysis of the NHW peptides obtained in step (c); (e) differential isotopic labeling of protein samples previously to step (a) or during steps (a) or (b) and immediately mixing at least a portion of the samples; and (f) relative quantifying of mixing at least a portion of the samples; and (f) relative quantifying of identified in step (d), as well as from the ratio between the areas of identified in step (d), as well as from the ratio between the areas of centimated theoretical spectra of the pair of NHM peptides, generated in step (d). Also described is a kit for the identification and quantification of proteins in complex mixtures, which comprises the method and entioned above. The method and kit are useful for identifying or quantifying proteins, such as those with vaccinal, therapeutic or capanets a surface protein A, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying and quantifying proteins in complex mixtures by selectively isolating peptides not containing histidine nor arginine from each protein, and determining the relative concentration of proteins in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lopez LJG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a pharmaceutical composition comprising a liposome associated with an isolated polypeptide derived from Noisseria meningitidis strain 608B, where the polypeptide is the NspA protein. The composition is useful for inducing an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection meningitidis, N. gonorrhoeae, N. lactamica and N. polysacchara. It is useful for treatment or prophylaxis of meningitis and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is a modified version of the Neisseria meningitidis strain 608B NspA protein. Note: This sequence is not shown in the specification but has been created based on the information given

The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic

The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen or their fragments, can be used as probes for the detection of pathogenic
                                                                                                                                                                                                                                            120

The invention is useful for preventing C. trachomatis or C. pneumoniae infection in a host. The present amino acid sequence represents a Neisseria gonorrhoeae protein as described in the invention

The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect N. specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

The present invention relates to a pharmaceutical composition comprising a liposome associated with an isolated polypeptide derived from Neisseria meningitidis strain 608B, where the polypeptide is the NBA protein. The composition is useful for inducting an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection and for treating and/or preventing neisserial infection chosen from N. meningitidis, N. gonorrhoeae, N. lactamica and N. polysaccharea. It is useful for treatment or prophylaxis of meningitis and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is a modified version of the Neisseria meningitidis strain 608B NBpA protein. Note: This sequence is not shown in the specification but has been created based on the information given

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

opacity protein opad precursor - Neisseria gonorrhoeae (strain MS11) (fragments)
Nylternate names: outer membrane protein opa58
C;Species: Neisseria gonorrhoeae
A;Variety: strain MS11
C;Date: 04-Jun-1997 #sequence revision 17-Oct-1997 #text_change 09-Jul-2004
C;Accession: S16611; S36345; S28624
C;Accession: S16611; S36345; S28624
Mol. Microbiol. 5, 1889-1901, 1991

the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A; Molecule type: DNA
A; Residues: 1-260 <-BHA.
A; Cross-references: UNIPROT: Q04882; UNIPARC: UPI00001781FB; EMBL: X52371
A; Experimental source: strain M311, variant 4.8
A; Note: the authors did not translate the sequence for the signal peptide
A; Note: expression of opacity proteins is regulated by the number of translated b; repeats place the start codon in frame with the rest of the protein

SY2343
OpenCity protein opaH precursor - Neisseria gonorrhoeae (isolate 15063G)
NyAlternate names: cell invasion protein opaH
Cispecies Neisseria gonorrhoeae
Cispecies Neisseria gonorrhoeae
A;Variety: isolate 15063G
C;Date: 14-Feb-1997 #sequence_revision 13-Mar-1997 #text_change 09-Jul-2004
C;Accession: 87243,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Indels
                                                                                                                                                                                                                                                                                                          CUMPRY: USA

ZIP: 2007-5109

COMPUTER READABLE FORM:

MEDIUW TYPE: Floppy disk

COMFUTER: IBM PC Compatible

OPERATING SYSTEM: PC-DOS/NS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/913,362

PILING DATE: 13-NOV-1997

PRIOR APPLICATION NUMBER: US 08/406,362

PILING DATE: 17-MAR-1995

PRIOR APPLICATION NUMBER: US 60/001,983

FILING DATE: 04-AUG-1995

ATTORNEY/AGENT INPORMATION:
NAME: Bent, Stephen A.

REGISTRATION NUMBER: 29,768

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19759, Application US/09252991A

Patent No. 6551795
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: NUMBER: US/09/252,991A
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
                                                                                                                                                                                                                                                                                                    57 N-DLRFAV-------DYTRYKNYKAPSTDFKLYSIGASAIYDFDTQSPVKPYLGA- 103

Patent No. 6673910
GRNERAL INFORMATION:
APPLICANT: GATY L. Breton et al.
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/540,236
CURRENT FILING DATE: 2000-04-04
SEQ ID NO 2792
LENGTH: 186
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 7451, Application US/09489039A
Sequence 7451, Application US/09489039A
Patent No. 6610836
GENERAL INFORMATION:
APPLICANT: Gary Brecon et. al
APPLICANT: Gary Brecon et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PREDMONIAE FOR DIAGNOSTICS AND THERAPBUTICS
FILE REFERENCE: 2709.2004001
CURRENT APPLICATION NUMBER: US 60/117,747
PRIOR PLING DATE: 2000-01-27
PRIOR APPLICATION NUMBER: US 60/117,747
PRIOR FILING DATE: 1999-01-29
NUMBER OF SEQ ID NOS: 14342
SEQ ID NO 7451
LENGTH: 385
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      13
